

Figure A. Main effects and interactions answer different questions
Sociality Relationship context

	Positive outcome	Negative outcome
Social	Social positive (A)	Social negative (B)
Nonsocial	Nonsocial positive (C)	Nonsocial negative (D)

Context main effect: $(A + B)/2 - (C + D)/2$

Positive context: $A - C$ Negative context: $B - D$

Valence main effect: $(A + C)/2 - (B + D)/2$

Context × valence interaction: $(A - B) - (C - D)$

	Positive outcome	Negative outcome
Friend	Friend positive (A)	Friend negative (B)
Stranger	Stranger positive (C)	Stranger negative (D)

Context main effect: $(A + B)/2 - (C + D)/2$

Positive context: $A - C$ Negative context: $B - D$

Valence main effect: $(A + C)/2 - (B + D)/2$

Context × valence interaction: $(A - B) - (C - D)$

Conceptual equal-category factorial contrast. The reused v4 valence comparator averages computer/friend/stranger equally.
